Whatever you want to get done, where ever you are, whenever you wish you can call Advanced Professional to book our emergency commercial plumbing and heating engineers 24 hours throughout festive periods.

### **What is an "Gas Interlock Systems" (GIS)?**

The failure of a commercial catering kitchen ventilation system represents a serious health and safety issue. Certain cooking equipment can potentially generate a high output of waste flue gases which are dangerous. Which is why current gas regulations now have a mandatory requirement for the installation of a gas interlock system in most modern commercial catering kitchens which should be fitted by a suitably accredited gas engineer. Gas interlock systems is system that gas is proving systems for commercial kitchen installation and school or college laboratory

- Cuts off gas flow in the event of kitchen extract fan failure
- Now a mandatory requirement in most commercial kitchens
- How G.I.S Works
- When is a Gas Interlock System a Mandatory Requirement
- System requirements
- Optional Extras
- Important documents

## **HOW GAS INTERLOCK SYSTEM (G.I.S) WORKS**

Sensors placed either side of the ductwork fan monitor air pressure. They are connected to an air differential switch, which is activated when the pressure difference changes. Alternatively the current taken by the fan can be monitored by a fan power sensor. The 230V G.I.S. monitors this switch/sensor and in the event of fan failure will close the gas solenoid and cut off the gas flow to kitchen appliances.

## **WHEN IS A GAS INTERLOCK SYSTEM A MANDATORY REQUIREMENT?**

- On installation of a completely new extraction/ventilation canopy
- On installation of a completely new gas pipework run
- On installation of a completely new cook line or layout

With any fitting of Category 'B' equipment e.g. combination ovens, deep fryers, grills, charcoal griddles. This includes replacements to an existing layout

## **SAFETY VALVES - *Low Pressure Cut-off Valves, Straight With UPSO***

Safety valves which cut off the gas following a loss of inlet pressure. The valves may be manually reset. The valves should only be reset after inlet pressure has been restored and any taps and/or valves have been checked closed. It is in theory possible to re-pressurise the system if there is an escape path smaller than the 1 mm bypass valve. The valves shut at the preset value of 15 mbar (6" wg). They must be mounted upright in horizontal pipework.

Example of What we offers:
