Knowledge about Over Flow Pipe Problem

An Overflowing toilet or water tank can waste water and also be annoying.

Problems: How do you fix a damp due to dripping overflow pipe,How do i stop my overflow pipe dripping?,How to stop the toilets overflow pipe from dripping?,I've got a badly dripping overflow pipe how do I fix this problem

When water flows into the toilet cistern there is a float valve that rises as the water level rises, the mechanism automatically shuts off the water supply when the water level reaches a preset level, when this fails to happen then the water will continue to flow into the cistern and eventually pour out through the overflow to the outside of the house. This can be both a waste of water and a huge annoyance. Here are some quick tips on how to: Fix a dripping overflow pipe for a toilet that won't stop running. In most modern toilets or WC's there is no need for an overflow pipe because water goes into the overflow tube and back into the toilet bowl - eliminating the need for an overflow pipe to the outside of the house.

1. In an old WC the Float valve arm is made of metal - simply bend the metal arm downwards to reduce the water level in the cistern

2. In a new WC/toilet the arm will be made of plastic - There should be a plastic screw and nut on the top of the arm
